- page no 2: The references of the next phrase (see below):

For this reason and as a continuation of our efforts directed toward the synthesis of heterocyclic compounds with expected biological activity, in this paper we describe the synthesis of some 1,2,4-triazolo[3,4-b]-1,3,4-thiadiazoles (1-8)[45] and 2-thioxo-4,5-imidazolidinediones (9-14)[46] (Scheme 1) bearing substituted (phenylsulfonyl)phenyl moiety. All synthesized compounds were tested for in vitro antimicrobial activity.

- page no 9:

For reasons of standardization metabolic microbiann we used as a marker of minimal *G- bacteria*, characterized by a very high adaptive plasticity mechanisms with very general in the sense of strict non-specificity. On this line moving to *G+ bacteria* brings tightening of nonspecific adaptive character, so to approximate the entire bacterial metabolic beach. Passage in the fungal metabolism of the plant very similar although a relatively high taxonomic level, however justified in this paper using saprophytic micro-parasitic frequency localization in human biosystems.
